Zephyr Instruction Sheet

Pitching your tent for the first time: we recommend that you practice pitching your tent before you actually leave for your first trip.

1. Choose a suitable pitching site by removing all sharp objects which may damage the floor. Spread out the tent on the ground, making sure the door zippers are closed.

2. Assemble the 3 pole sets, making sure all the pole sections slide completely together. The shorter and thinner pole is the spreader bar (see Step 4).

   \[ x \ 2 \]

   \[ x \ 1 \]

3. Lay the 2 main assembled tent pole sets next to the tent. Start by threading these poles through the tent pole sleeves. Place the 4 pole tips into the grommets located at the corners of the tent. Finish by attaching the tent clips around the poles.

4. Finalize the assembly by placing the spreader bar into the grommets located at the eave corners, as shown.

   **Spreader Bar**

**Fly Assembly Notes:**

**Zephyr 1** – The vestibule is on the end.

**Zephyr 2 & 3** – The vestibules are on the sides.

Both sketches shown below are for a Zephyr 2 or 3 with the side vestibules.

5. Lay the flysheet over the tent. Attach the buckle from each corner of the flysheet to the buckle at each corner of the tent. The webbing from the flysheet to the buckle can be adjusted to properly tension the flysheet. The flysheet should be snug, but not overly stretched.

6. Place a tent peg at each vestibule corner. You'll notice that there are 2 loops at each corner of the Zephyr 2 & 3 vestibules, which lets you decide which side of the vestibule you want to roll back as you enter and exit the tent.

7. If the conditions are windy, or if you anticipate that it may become windy, it is advisable to attach the guy lines as shown in the sketch below. The most important guy lines are the ones on the side of the tent where the wind is blowing. Proper guying on the side of the wind will keep the tent from shifting around.
